187 hreflang conflicts within page source code **About this issue:** If you're running a multilingual website, it is necessary to help users from other countries find your content in the language that is most appropriate for them. This is where the hreflang (rel="alternate" hreflang="x") attribute comes in handy. This attribute helps search engines understand which page should be shown to visitors based on their location. It is very important to properly synchronize your hreflang attributes within your page's source code, otherwise you may experience unexpected search engine behavior. For more information, see this article. **How to fix:** To avoid any conflicts, we recommend that you review your hreflang attributes within your page's source code and fix any of the following issues: - Conflicting hreflang and rel=canonical URLs - Conflicting hreflang URLs - No self-referencing hreflang URLs	187 ↓3
133 incorrect pages found in sitemap.xml **About this issue:** A sitemap.xml file makes it easier for crawlers to discover the pages on your website. Only good pages intended for your visitors should be included in your sitemap.xml file. This error is triggered if your sitemap.xml contains URLs that: - lead to webpages with the same content - redirect to a different webpage - return non-200 status code Populating your file with such URLs will confuse search engines, cause unnecessary crawling or may even result in your sitemap being rejected. **How to fix:** Review your sitemap.xml for any redirected, non-canonical or non-200 URLs. Provide the final destination URLs that are canonical and return a 200 status code.	133 ↓4

Errors	Amount
50 structured data items are invalid **About this issue:** This issue is triggered if structured data items contain fields that do not meet Google's guidelines. Implementing and maintaining your structured data correctly is important if you want to get an edge over your competitors in search results. If your website markup has errors, crawlers will not be able to properly understand it, and you may run the risk of losing the chance of gaining rich snippets and getting more favorable rankings. For more information on the structured data requirements, see schema.org, Google documentation, or our article. **How to fix:** Check structured data on your webpages with a validation tool. Please note that different markup testing tools may show different results. We recommend that you use the Rich Results Test tool to review and validate your pages' structured data against their rich snippet requirements.	50 0
23 pages returned 4XX status code **About this issue:** A 4xx error means that a webpage cannot be accessed. This is usually the result of broken links. These errors prevent users and search engine robots from accessing your webpages, and can negatively affect both user experience and search engine crawlability. This will in turn lead to a drop in traffic driven to your website. Please be aware that crawler may detect a working link as broken if your website blocks our crawler from accessing it. This usually happens due to the following reasons: - DDoS protection system - Overloaded or misconfigured server **How to fix:** If a webpage returns an error, remove all links leading to the error page or replace it with another resource. To identify all pages on your website that contain links to a 4xx page, click "View broken links" next to the error page. If the links reported as 4xx do work when accessed with a browser, you can try either of the following: - Contact your web hosting support team - Instruct search engine robots not to crawl your website too frequently by specifying the "crawl-delay" directive in your robots.txt	23 ↑7

Errors	Amount
23 internal links are broken **About this issue:** Broken internal links lead users from one webpage to another and bring them to non-existent webpages. Multiple broken links negatively affect user experience and may worsen your search engine rankings because crawlers may think that your website is poorly maintained or coded. Please note that our crawler may detect a working link as broken. Generally, this happens if the server hosting the website you're referring to blocks our crawler from accessing this website. **How to fix:** Please follow all links reported as broken. If a target webpage returns an error, remove the link leading to the error page or replace it with another resource. If the links reported as broken do work when accessed with a browser, you should contact the website's owner and inform them about the issue.	23 ↑5
8 issues with incorrect hreflang links **About this issue:** A hreflang (rel="alternate" hreflang="x") attribute helps search engines understand which page should be shown to visitors based on their location. Utilizing this attribute is necessary if you're running a multilingual website and would like to help users from other countries find your content in the language that is most appropriate for them. It is very important to make sure your hreflang links always refer to absolute URLs with HTTP 200 status codes, otherwise search engines will not be able to interpret them correctly and, as a result, will not show the correct language version of your pages to the relevant audience. For more information, please see these articles: Tell Google about localized versions of your page, How to Do International SEO with Semrush and Hreflang Attribute 101 **How to fix:** To avoid any problems with hreflang links, we recommend that you review your hreflang attributes and do the following: - Fix broken hreflang URLs - Fix hreflang redirects - Replace relative URLs with absolute ones	8 ↑7

Errors	Amount
7 pages with a broken canonical link **About this issue:** By setting a rel="canonical" element on your page, you can inform search engines of which version of a page you want to show up in search results. When using canonical tags, it is important to make sure that the URL you include in your rel="canonical" element leads to a page that actually exists. Canonical links that lead to non-existent webpages complicate the process of crawling and indexing your content and, as a result, decrease crawling efficiency and lead to unnecessary crawl budget waste. **How to fix:** Review all broken canonical links. If a canonical URL applies to a non-existent webpage, remove it or replace it with another resource.	7 ↑7
3 issues with broken internal JavaScript and CSS files **About this issue:** A broken JavaScript or CSS file is an issue that should be watched out for on your website. Any script that has stopped running on your website may jeopardize your rankings, since search engines will not be able to properly render and index your webpages. Moreover, broken JS and CSS files may cause website errors, and this will certainly spoil your user experience. **How to fix:** Review all broken JavaScript and CSS files hosted on your website and fix any issues.	3 0
0 pages returned 5XX status code	0 0
0 pages don't have title tags	0 0

Warnings

Warnings

Project name: brightai.site

Warnings	Amount
347 issues with unminified JavaScript and CSS files **About this issue:** Minification is the process of removing unnecessary lines, white space and comments from the source code. Minifying JavaScript and CSS files makes their size smaller, thereby decreasing your page load time, providing a better user experience and improving your search engine rankings. For more information, please see this Google article. **How to fix:** Minify your JavaScript and CSS files. If your webpage uses CSS and JS files that are hosted on an external site, contact the website owner and ask them to minify their files. If this issue doesn't affect your page load time, simply ignore it.	347 ↓ 10
232 pages have low text-HTML ratio **About this issue:** Your text to HTML ratio indicates the amount of actual text you have on your webpage compared to the amount of code. This issue is triggered when your text to HTML is 10% or less. Search engines have begun focusing on pages that contain more content. That's why a higher text to HTML ratio means your page has a better chance of getting a good position in search results. Less code increases your page's load speed and also helps your rankings. It also helps search engine robots crawl your website faster. **How to fix:** Split your webpage's text content and code into separate files and compare their size. If the size of your code file exceeds the size of the text file, review your page's HTML code and consider optimizing its structure and removing embedded scripts and styles.	232 0

Warnings	Amount
36 pages have a low word count **About this issue:** This issue is triggered if the number of words on your webpage is less than 200. The amount of text placed on your webpage is a quality signal to search engines. Search engines prefer to provide as much information to users as possible, so pages with longer content tend to be placed higher in search results, as opposed to those with lower word counts. For more information, please view this video **How to fix:** Improve your on-page content and be sure to include more than 200 meaningful words.	36 0
9 external links are broken **About this issue:** Broken external links lead users from one website to another and bring them to non-existent webpages. Multiple broken links negatively affect user experience and may worsen your search engine rankings because crawlers may think that your website is poorly maintained or coded. Please note that our crawler may detect a working link as broken. Generally, this happens if the server hosting the website you're referring to blocks our crawler from accessing this website. **How to fix:** Please follow all links reported as broken. If a target webpage returns an error, remove the link leading to the error page or replace it with another resource. If the links reported as broken do work when accessed with a browser, you should contact the website's owner and inform them about the issue.	9 ↑1
7 pages have underscores in the URL **About this issue:** When it comes to URL structure, using underscores as word separators is not recommended because search engines may not interpret them correctly and may consider them to be a part of a word. Using hyphens instead of underscores makes it easier for search engines to understand what your page is about. Although using underscores doesn't have a huge impact on webpage visibility, it decreases your page's chances of appearing in search results, as opposed to when hyphens are used. For more information, please see this Google article **How to fix:** Replace underscores with hyphens. However, if your page ranks well, we do not recommend that you do this.	7 0

Notices

Notices

Project name: brightai.site

Notices	Amount
101 pages have only one incoming internal link **About this issue:** Having few incoming internal links means little to no visits or chances of being placed in search results. **How to fix:** Add more incoming internal links to pages with important content.	101 ↓16
54 URLs with a permanent redirect **About this issue:** Although using permanent redirects (a 301 or 308 redirect) is appropriate in many situations (for example, when you move a website to a new domain, redirect users from a deleted page to a new one, or handle duplicate content issues), we recommend that you keep them to a reasonable minimum. Every time you redirect one of your website's pages, it decreases your crawl budget, which may run out before search engines can crawl the page you want to be indexed. Moreover, too many permanent redirects can be confusing to users. **How to fix:** Review all URLs with a permanent redirect. Change permanent redirects to a target page URL where possible.	54 ↓5
42 pages are blocked from crawling **About this issue:** If a page cannot be accessed by search engines, it will never appear in search results. A page can be blocked from crawling either by a robots.txt file or a noindex meta tag. **How to fix:** Make sure that pages with valuable content are not blocked from crawling by mistake.	42 0

Notices	Amount
15 pages need more than 3 clicks to be reached **About this issue:** A page's crawl depth is the number of clicks required for users and search engine crawlers to reach it via its corresponding homepage. From an SEO perspective, an excessive crawl depth may pose a great threat to your optimization efforts, as both crawlers and users are less likely to reach deep pages. For this reason, pages that contain important content should be no more than 3 clicks away from your homepage. **How to fix:** Make sure that pages with important content can be reached within a few clicks. If any of them are buried too deep in your site, consider changing your internal link architecture.	15 0
9 orphaned pages in sitemaps **About this issue:** An orphaned page is a webpage that is not linked to internally. Including orphaned pages in your sitemap.xml files is considered to be a bad practice, as these pages will be crawled by search engines. Crawling outdated orphaned pages will waste your crawl budget. If an orphaned page in your sitemap.xml file has valuable content, we recommend that you link to it internally. **How to fix:** Review all orphaned pages in your sitemap.xml files and do either of the following: - If a page is no longer needed, remove it - If a page has valuable content and brings traffic to your website, link to it from another page on your website - If a page serves a specific need and requires no internal linking, leave it as is	9 ↓1
2 issues with broken external JavaScript and CSS files **About this issue:** If your website uses JavaScript or CSS files that are hosted on an external site, you should be sure that they work properly. Any script that has stopped running on your website may jeopardize your rankings, since search engines will not be able to properly render and index your webpages. Moreover, broken JavaScript and CSS files may cause website errors, and this will certainly spoil your user experience. **How to fix:** Contact the website owner and ask them to fix a broken file.	2 0

Notices	Amount
2 links on this page have no anchor text **About this issue:** The issue is triggered if a link (external or internal) on your site has an empty or naked anchor (i.e., just a URL), or anchor text only contains special characters. This issue makes it difficult for the crawlers to understand what the page is about and affects the performance of the linked-to page in search results. **How to fix:** Use anchor text for your links where it is necessary. The link text must give users and search engines at least a basic idea of what the target page is about. Also, use short but descriptive text. Learn more	2 0
0 pages have more than one H1 tag	0 0
